

DevOps and Agile Concepts

1. What is DevOps

DevOps is a combination of **Development (Dev)** and **Operations (Ops)** practices that improves collaboration between software developers and IT operations teams. Its main goal is to deliver software faster, more reliably, and continuously through automation and teamwork.

Core Principles of DevOps

- **Collaboration** – Dev and Ops teams work together throughout the software lifecycle.
- **Continuous Integration (CI)** – Developers frequently merge code into a shared repository with automated builds and testing.
- **Continuous Delivery/Deployment (CD)** – Applications are always ready for deployment through automated release pipelines.
- **Infrastructure as Code (IaC)** – Infrastructure is managed using code tools like Terraform and Ansible.
- **Monitoring and Feedback** – Continuous monitoring helps identify and resolve issues quickly.
- **Automation** – Repetitive tasks such as testing, deployment, and scaling are automated.

2. Advantages of DevOps

- Faster time to market through continuous integration and continuous delivery.
- Improved collaboration between development, testing, and operations teams.
- Higher software quality with automated testing and monitoring.
- Increased deployment frequency with reliable release pipelines.
- Reduced failure rate due to smaller and incremental changes.

3. What is Agile and Scrum

3.1 Agile

Agile is a software development methodology that focuses on:

- Iterative development
- Customer collaboration
- Flexibility
- Continuous improvement

Work is divided into short cycles called **Sprints** or **Iterations**.

4 Core Values of Agile

- Individuals and interactions over processes and tools
- Working software over comprehensive documentation
- Customer collaboration over contract negotiation
- Responding to change over following a plan

3.2 Scrum

Scrum is a popular Agile framework used to manage software development projects through short and fixed-duration sprints.

Scrum Ceremonies

- **Sprint Planning** – Planning tasks for the upcoming sprint.
- **Daily Standup** – 15-minute daily meeting to discuss progress and blockers.
- **Sprint Review** – Demonstration of completed work to stakeholders.
- **Sprint Retrospective** – Discussion on improvements for the next sprint.
- **Backlog Refinement** – Updating and prioritising backlog items.

4. Product Owner (PO) and Scrum Master in Agile

4.1 Product Owner (PO)

The Product Owner represents customer and business requirements within the Scrum team.

Responsibilities

- Manage and prioritise the Product Backlog.
- Write user stories and acceptance criteria.
- Communicate with stakeholders.
- Approve or reject completed sprint work.
- Maintain product vision and roadmap.

4.2 Scrum Master

The Scrum Master ensures the Scrum process is followed correctly and helps the team work efficiently.

Responsibilities

- Facilitate Scrum meetings and ceremonies.
- Remove blockers and obstacles.
- Coach the team on Agile practices.
- Protect the team from distractions.
- Track sprint progress and team performance.
- Encourage continuous improvement.

5. Advantages of Agile

- Faster delivery of working software in every sprint.
- Flexibility to adapt to changing requirements.
- Improved customer satisfaction through continuous feedback.
- Early risk detection and quicker issue resolution.
- Better team collaboration and morale.
- Higher product quality through regular testing and reviews.
