

Running Apache Airflow in Killercodea Using Docker

Step 1: Open Killercodea

Open Ubuntu playground:

<https://killercodea.com/playgrounds/scenario/ubuntu>

Step 2: Run Airflow Container

```
docker run -d -p 8080:8080 --name airflow apache/airflow standalone
```

This command downloads and starts Apache Airflow in Docker.

Step 3: Check Running Container

```
docker ps
```

This command shows running Docker containers.

Step 4: View Logs

```
docker logs airflow
```

This command displays Airflow logs and login credentials.

Step 5: Open Airflow UI

Open port 8080 from the browser and log in using the username and password shown in the logs.

Steps Performed Inside Killercoda Ubuntu Terminal

```
docker exec -it airflow bash
```

Step 6: Navigate to DAGs Folder

```
cd /opt/airflow/dags
```

Step 7: Create DAG File

```
cat > first_dag.py
```

Paste the DAG Python code and press CTRL + D to save.

Step 8: Verify File Creation

```
ls
```

This command checks whether the DAG file is created successfully.

Step 9: Restart Airflow Container

```
docker restart airflow
```

This reloads Apache Airflow and detects the newly created DAG.

Step 10: Verify DAG in Dashboard

Refresh the Airflow dashboard in the browser.

The newly created DAG (first_dag) will appear in the UI
